

CodeQuestHub.io - GDB Cheat Sheet

<p>Starting / Stopping / Attaching</p> <p><code>gdb <program></code> - Start GDB with a program</p> <p><code>gdb -p <pid></code> - Attach to a running process</p> <p><code>gdb <program> <core></code> - Load a core dump</p> <p><code>attach <pid></code> - Attach to a PID</p> <p><code>set args <args></code> - Set program arguments</p> <p><code>run</code> - Run the program</p> <p><code>start</code> - Run until <code>main()</code></p> <p><code>kill</code> - Send the kill signal</p> <p><code>detach</code> - Detach from the process</p>	<p>Printing / Inspecting State</p> <p><code>print <expr></code> - Evaluate and print expression</p> <p><code>display <expr></code> - Display expression on every loop</p> <p><code>info locals</code> - Show local variables</p> <p><code>info args</code> - Show function arguments</p> <p><code>info registers</code> - Show CPU registers</p> <p><code>x/<format> <address></code> - Examine memory</p> <p><code>set var <var>=<value></code> - Set a variable value</p> <p><code>disassemble</code> - Disassemble a function</p> <p><code>info variables</code> - Show global and static variables</p>	<p>Stack Traces and Info</p> <p><code>backtrace</code> - Show call stack</p> <p><code>where</code> - Alias for <code>backtrace</code></p> <p><code>frame <n></code> - Select stack frame</p> <p><code>up / down</code> - Move up/down one frame</p> <p><code>info threads</code> - Show threads</p> <p><code>info breakpoints</code> - Show breakpoints</p> <p><code>info files</code> - Show loaded files</p> <p><code>info sharedlibrary</code> - List loaded shared libraries</p> <p><code>whatis <var></code> - Show type of variable</p>
<p>Breakpoints / Navigation</p> <p><code>break <function></code> - Set breakpoint at function</p> <p><code>break <file>:<line></code> - Set breakpoint at <code>file:line</code></p> <p><code>tbreak <function></code> - Temporary breakpoint</p> <p><code>delete <n></code> - Delete breakpoint number <code>n</code></p> <p><code>disable <n></code> - Disable breakpoint number <code>n</code></p> <p><code>enable <n></code> - Enable breakpoint number <code>n</code></p> <p><code>continue</code> - Continue running after breakpoint</p> <p><code>step</code> - Step into function call</p> <p><code>next</code> - Step over function call</p> <p><code>finish</code> - Run until current function returns</p> <p><code>watch <expr></code> - Break when expression written</p> <p><code>rwatch <expr></code> - Break when expression read</p> <p><code>awatch <expr></code> - Break when expression accessed</p> <p><code>break <loc> if <cond></code> - Conditional breakpoint</p> <p><code>condition <n> <expr></code> - Set condition on breakpoint</p> <p><code>commands <n></code> - Set commands to run at breakpoint <code>n</code></p> <p><code>ignore <n> <count></code> - Skip breakpoint <code>n</code> <code>count</code> times</p>	<p>Reverse Debugging</p> <p><code>record</code> - Start recording execution</p> <p><code>record stop</code> - Stop recording</p> <p><code>reverse-stepi</code> - Step backward one instruction</p> <p><code>reverse-continue</code> - Continue backward to breakpoint</p>	<p>Signals</p> <p><code>info signals</code> - List all signals and handling</p> <p><code>handle <signal> <actions></code> - Set signal handling</p> <p><code>signal <signal></code> - Deliver signal manually</p> <p><code>catch <signal></code> - Break when a signal is raised</p>
<p>Memory Display (& Command) Format and Examples</p>		
<p><code>b</code> Byte (1 byte) <code>x/4xb \$esp</code></p> <p><code>h</code> Half word (2 bytes) <code>x/8xh \$esp</code></p> <p><code>w</code> Word (4 bytes) <code>x/2xw 0x61050</code></p> <p><code>g</code> Giant word (8 bytes) <code>x/1xg \$rbp</code></p> <p><code>c</code> Char <code>x/10cb \$esp</code></p> <p><code>d</code> Signed decimal <code>x/6dw 0x400600</code></p> <p><code>u</code> Unsigned decimal <code>x/4uw \$esp</code></p> <p><code>x</code> Hexadecimal <code>x/4xw \$esp</code></p> <p><code>o</code> Octal <code>x/4ow \$esp</code></p> <p><code>t</code> Binary <code>x/5tb \$esp</code></p> <p><code>s</code> C String <code>x/s 0x601000</code></p> <p><code>a</code> Address pointer <code>x/a \$rbp</code></p>	<p>4 bytes at stack pointer, hex</p> <p>8 half words at stack pointer, hex</p> <p>2 words at address 0x61050, hex</p> <p>1 giant word at frame pointer, hex</p> <p>10 bytes at stack pointer, as chars</p> <p>6 words as signed decimals</p> <p>4 words as unsigned decimals</p> <p>4 words as hex</p> <p>4 words as octal</p> <p>5 bytes as binary</p> <p>View memory as C string</p> <p>View address at base pointer</p>
